

Run a Voxibot Docker container

- **Web site** : <https://www.docker.com>

Docker is the original author and primary sponsor of the Docker open source project. Together with the community of maintainers and contributors, Docker aims to deliver open tools to help developers build applications with open APIs to help sysadmins better manage these applications.

The screenshot shows the Docker Hub interface for the repository `voximal/voxibot`. The page includes a search bar, navigation links for 'Explore' and 'Help', and a 'Sign up' / 'Log in' button. The repository is listed as a 'PUBLIC REPOSITORY' with a star icon and a note that it was 'Last pushed: 5 hours ago'. Below this, there are tabs for 'Repo Info' and 'Tags'. The main content area is divided into several sections: 'Short Description' (stating it's a VoiceXML browser using voximal, asterisk, and FreePBX), 'Full Description' (providing more details about the software and its integration), 'Docker Pull Command' (displaying `docker pull voximal/voxibot`), and 'Owner' (showing the user 'voximal'). A code block at the bottom of the description shows the command to run the container: `docker run -i -t -p 80:80 -p 4569:4596/udp voximal/voxibot:latest my_init -- bash`. There is also a 'Comments (0)' section at the bottom.

Getting started with Docker

Connect to your docker and execute :

```
# docker run -i -t -p 80:80 -p 4569:4596/udp voximal/voxibot:latest my_init -- bash -l
```

Check latest release from docker hub directory : <https://hub.docker.com/r/voximal/voxibot/>
