# **Voximal Web Configuration**

### Access

All the configuration is managed throw a web interface based on the FreePBX project. To access to the web interface, open the link

### http://your\_server\_address/admin.

It's protected by a login (the first login after the installation will request you a password).

# Login

After installation there are 3 default login accounts, with differents access permissions

- **user** : access to Voximal configuration and reports.
- admin : user access and network configuration
- root : full access (full freePBX features).

Each login have a default password (requested after the package installation, or the image activation), you can be change them with the root account.

## **System Status**

The home page after login show you the system status.

- Host name of the server
- Summary : Main modules status
- Interpreter statistics
- Telephony statistics
- Uptime / Load average

### Main configuration steps

2025/04/04 03:01

To configure the Voximal IVR you have 4 steps to do :

- 1. Configure the VoIP telephony access (SIP accounts)
- 2. Create/edit a VoiceXML service (Create a VoiceXML service)
- 3. Create Voximal accounts (Voximal accounts)
- 4. Configure the relation between the DID and the VoiceXML service you want to use (Routes configuration)

**Note**: On each configuration page, don't forget to click on **[Submit]** button at the bottom page before changing page. If you don't click on **[Submit]** you'll lose all your changes.

**Note**: All changes are not directly configure on the server. After one change, you'll see a button **[Apply Config]** in menu. To activate the changes on server <u>you have to click on</u> **[Apply Config]**.

### 1) Configure the telephony access

#### a) Use the test number and the PIN

If your server is connected to the internet you can use the free test access to place calls to your server. There is nothing to do. You should only check that the port 4569 is open from/to internet in UDP.

Last update: 2016/10/25 installation\_guide:configuration:start https://wiki.voximal.com/doku.php?id=installation\_guide:configuration:start&rev=1477430579 21:22

#### b) Connect a trunk SIP

Before you can make external calls or accept incoming calls from outside, you need to setup SIP Trunks. You can choose any VoIP Service providers. You can create a SIP trunk with an operator referenced in the page Voip Providers. You have to enter informations :

- A trunk name : a string to identify you accounts
- The peers details : enter all trunk informations (host, username, password, type)

```
host=myprovider.com
username=0033123456789
type=peer
```

• Register informations : enter registry informations like :

0033123456789:password@myprovider.com/33123456789

• Click on [submit] button (don't remember to apply your modifications)

#### c) Add an extension

After you setup your Voxibot, the first thing you do is to add extensions (connect a Phone). The integrated FreePbx allows you to add a couple of different Device types

- Generic SIP Device
- Generic IAX2 Device
- Generic DAHDi Device
- Other Custom Device

Among these types, SIP device is the most common and popular one.

You can give your extension any unique number, Display Name, password, whether allow this extension to accept inbound external calls or can make outbound external calls. can have voicemail or not etc.

### 2) Create a VoiceXML service

You need to create VoiceXML service, by uploading it or writing it directly with the embedded VoiceXML/PHP editor. Select the application menu **Voximal**.

#### Uploading VoiceXML service

	Accounts E				
irec	tory: / var / ww	/w / html / vxr	nl 🥔		
	Filename	Туре	Size (bytes)	Date Modified	
ŧ.	messaging.tgz	TGZ File	3,072,973	Aug 19 2015 3:53 PM	
ŧ.	dem o.tgz	TGZ File	137,915	Aug 17 2015 9:50 AM	
١.	vernai	<directory></directory>		Feb 8 2016 9:26 AM	
Û	messaging	<directory></directory>		Oct 29 2015 2:36 PM	
ŵ	app1	<directory></directory>		Jun 25 2015 5:56 PM	
Û	campaign	<directory></directory>		Apr 26 2016 4:58 PM	
١.	tests	<directory></directory>		Mar 9 2016 10:45 PM	
Û	helloworld	<directory></directory>		Apr 27 2016 10:07 AM

Û	demo	<directory></directory>		Oct 10 2016 5:17 PM	

In page Applications/Voximal click on **Editor** tab. At the end of the page, you have the way to upload files :

- Click on **Browse** and select your files (.vxml, .php, ...).
- Then click on [Upload]. Your files will appear in list.

#### Create VoiceXML service with editor

You can update VoiceXML file (extension .vxml), by clicking on the filename. The file content will appear, and you'll be able to update it, and check the syntax.

The editor page allow to create folders and files, and edit them.

To create folders or files, click on right items on top right corner (Create Directory or Create File).

Then enter filename, and click [Create].

Version 1.0.121 18 Oct 10:10:36		Support

### 3) Create a Voximal account

When your VoiceXML services is ready, you have to configure it in the server. To do it, add Voximal account. Select the **Voximal** menu item.

To create a Voximal Account, you have to define in minimum 2 required informations :

- 1. An application name, in field **Name**
- 2. The VoiceXML url of the service, in field **URL**. You can select a local one, in the list or writing a local or HTTP one.

There are several options :

- 1. **Max sessions** : you can define a specific limit, if you want lower maximum session than the license.
- 2. **Dial format** : you can define a specific dialout format for outgoing calls.
- 3. **Mark** : you can define a specific mark, that will appear in traces.
- 4. **Speech** : you can specify the use of the ASR. In case of using ASR server, the better way is to set **Automatic** choice.
- 5. **Max time** : you can set a maximum duration of call. If not setted or equals to 0, the duration is unlimited.
- 6. **Vxml parameter** : you can set a string to pass it to vxml script.
- 7. **Start delay** : you can set a time delay to start the service.

2025/04/04	03:01

tart delay (ms) 🖤	2000	

### 4) Number/Routes configuration

You have your DID number and SIP Trunk set up (with the test number, the called number will be 4568 : "VXML" in the dialpad). If you set up the inbound rules, you define when people call your DID number (for example 555-555-555) how your Voxiboy handle such call, normally you set up a Voximal Account (where you define the first VoiceXML document of your voice portal).

You can to define which application you want to use by default for all incoming calls. It's done by defining the **any DID/any CID** or **All DIDs** settings in **Connectivity/Numbers** page.

- 1. Select All DIDs item (on top right corner)
- 2. Leave empty Field **DID Number**
- 3. Select the application to use : Voximal Application
  - You can select an existing application (for example Voximal)
  - Or create a new one by clicking "Add new Voximal application"
- 4. Click on **[submit]** button.
