## Installation

[Enter content here]

## Setup

Be careful, respect the order for starting and stopping the full VoiceXML modules :

To start the platform orderly:

- Start Dahdi (optional)
- Start VXI
- Start Asterisk

To stop it, orderly :

- Stop Asterisk
- Stop VXI
- Stop Dahdi (optional)

### Start Dahdi deamon

To start the dahdi driver:

```
# /etc/init.d/dahdi start
```

To stop the dahdi driver:

```
# /etc/init.d/dahdi stop
```

### Start Vxi deamon

The VoiceXML browser software is installed in /usr/sbin and /usr/lib/openvxi. The VoiceXML browser setup script on Linux is /etc/init.d/openvxi. The openvxi script calls the /usr/sbin/safe\_openvxi executable that functions as a monitor and auto-loader for your VoiceXML browser system. This safe\_openvxi starts VoiceXML browser and monitors it to make sure it is still running. If the VoiceXML browser process dies, the script will attempt to restart it.

```
# /etc/init.d/openvxi start
```

To stop the VXI\* deamon:

```
# /etc/init.d/openvxi stop
```

NOTE:

This startup script runs only for Debian/Ubuntu Linux distributions, please modify or install a correct this script file to launch correctly Vxi from other Linux systems. We provide a script to start the actual, AsteriskNOW linux distribution from Digium.

## Start Asterisk deamon

For production setups, we use safe\_asterisk wrapper to catch any asterisks error, avoiding to restart asterisk manauly. This script will start a new asterisk instance when asterisk process is missing. So if you really want to stop asterisk, you must stop safe\_asterisk script first.

Start asterisk: (just call the wrapper)

```
#safe_asterisk
```

Stop asterisk:

```
#killall -9 safe_asterisk && asterisk -x 'core stop gracefully'
```

NOTE:

On production server there can be a CRON command line restarting asterisk automatically each morning, using safe\_asterisk is mandatory. Check with "#crontab -l", if there is any asterisk killall commands related with asterisk.
